

Welcome to your Workplace Insights report. You were asked to take assessments powered by Criteria Corp, and this report provides an overview of your personalised results. All of your responses were combined to create a unique profile for you. Within the report, it's important to know that there are no "good" or "bad" qualities. The results are designed to help you heighten your self-awareness and to understand how to relate better to others in the workplace.

Problem Solving

People can vary in the skills they rely on to solve problems. Some may be better at solving written and verbal problems, some may be better with numerical and number-based problems, while others are better at problems that are abstract, spatial or conceptual in nature. Knowing which of these areas is stronger for you can help you to apply your strengths when solving problems at work.

Your strengths are likely to be in the area of numerical or number based problems and in the area of abstract, conceptual or spatial problems. You may be more comfortable thinking about problems in these forms.

Common problem solving situations involving the use of numerical or abstract and spatial information include:

- Drawing conclusions from tables or lists of numbers.
- Conducting numerical analyses.
- Drawing conclusions about conceptual rules or categories.
- Interpreting diagrammatic spatial information.

Development Suggestions

You are likely to be most effective at solving numerical, abstract or spatial problems. One way to develop your effectiveness in problem solving may be to approach problems from a numerical, abstract or spatial perspective. For example, problems could be framed numerically by describing them in numbers, charts or graphs. Problems could be framed in an abstract or spatial manner by expressing them in terms of conceptual rules, categories or diagrams.
